2 Problema 2 - Sudoku

Da definição do jogo "Sudoku" generalizado para a dimensão N; o problema tradicional corresponde ao caso $N = 3$. O objetivo do Sudoku é preencher uma grelha de $N^2 \times N^2$ com inteiros positivos no intervalo 1 até N^2, satisfazendo as seguintes regras: - Cada inteiro no intervalo 1 até N^2 ocorre só uma vez em cada coluna, linha e secção $N \times N$. - No início do jogo uma fração $0 \leq < 1$ das N^4 casas da grelha são preenchidas de forma consistente com a regra anterior.

2.1 Implementação

Para a resolução deste problema, utilizaremos um solver disponivel na biblioteca de programação linear do OR-Tools, o *pywraplp*. Portanto, começaremos por instalar o OR-Tools.

[1]:
```
!pip install ortools
```

```
Requirement already satisfied: ortools in /usr/local/lib/python3.8/dist-packages
(9.1.9490)
Requirement already satisfied: protobuf>=3.18.0 in
/usr/local/lib/python3.8/dist-packages (from ortools) (3.18.1)
Requirement already satisfied: absl-py>=0.13 in /usr/local/lib/python3.8/dist-
packages (from ortools) (0.14.1)
Requirement already satisfied: six in /usr/lib/python3/dist-packages (from absl-
py>=0.13->ortools) (1.14.0)
```

[4]:
```
import math
import random
import timeit
import time
from ortools.linear_solver import pywraplp
import matplotlib.pyplot as plt
```

2.1.1 Variaveis do Problema

Para resolver o problema foram utilizadas $N^2 \times N^2 \times N^2$ variavies binarias, que nos premite verificar qual o número que vai ser colocado numa determinada linha e coluna da grelja do sudoku. Assim sendo foi definido o seguinte grupo de variavies: - $cube_{row,col,depth}$ - variavel que represena o número $depth + 1$ na linha row e na coluna col.

2.1.2 Restrições

- $\forall_{row,col,row}\ cube[(row, col, depth)] \in \{0, 1\}$
- $\forall_{row,col} \sum_{depth} cube[(row, col, depth)] == 1$
- $\forall_{row,depth} \sum_{col} cube[(row, col, depth)] == 1$
- $\forall_{depth,col} \sum_{row} cube[(row, col, depth)] == 1$

Seja n uma secção $N \times N$ do cubo: - $\forall_{n_{row},n_{col}} \sum_{depth} cube[(n_{row}, n_{col}, depth)] == 1$ - $\forall_{n_{row},depth} \sum_{n_{row}} cube[(n_{row}, n_{col}, depth)] == 1$ - $\forall_{depth,n_{col}} \sum_{n_{row}} cube[(n_{row}, n_{col}, depth)] == 1$

2.1.3 Função que imprime a grelha do sudoku

[5]:
```
def print_sudoku(sudoku):
    grid = 0
    l = len(sudoku)
    n = int(math.sqrt(l))
    pad = 1 + l // 10
    r = (l + n) * (pad + 1)  +1
    if n > 4 and not grid:
        for i in range(l):
            for j in range(l):
                print(f'{sudoku[i][j]}'.ljust(pad), end = " ")
            print('')
        return

    for i in range(l):
        if i % n == 0:
            print("-"*r)
        for j in range(l):
            if  j % n == 0:
                print("|".ljust(pad), end = " ")
            print(f'{sudoku[i][j]}'.ljust(pad), end = " ")
            if  j == l-1:
                print("|".ljust(pad), end = " ")
        print('')
    print("-" * r)
```

2.1.4 Função auxiliar que converte o resultado do solver numa matriz

[6]:
```
def converter(cube,dim):
    mat = [[0 for a in range(dim)] for b in range(dim) ]
    for row in range(dim):
        for col in range(dim):
            for depth in range(dim):
                if cube[(row,col,depth)].solution_value() == 1:
                    mat[row][col] = depth + 1
    return mat
```

2.1.5 Função que inicializa a grelha do sudoku

Recebe como parametros a dimensão N e a fracção $0 < 1$ de casas que sao preenchidas. Para tal coloca N números aletorios e depois tenta resolver o sudoku. De seguida apaga o número de números necessários para satisfazer

[23]:
```
def sudoku_generator(N, alpha):
    dim = N*N
    delete = int(dim * dim * (1-alpha))
    num_squares = int(math.sqrt(dim))
    solver = pywraplp.Solver.CreateSolver('SCIP')
    cube = {}

    if alpha == 0:
        mat = [[0 for c in range(dim)] for r in range(dim)]
        return mat

    for row in range(dim):
        for col in range(dim):
            for depth in range(dim):
                cube[(row,col,depth)] = solver.BoolVar('%i%i%i' %␣
↪(row,col,depth))

    for row in range(dim):
        for col in range(dim):
            val = []
            for depth in range(dim):
                val.append(cube[(row,col,depth)])
            solver.Add(sum(val) == 1)

    for row in range(dim):
        for depth in range(dim):
            val = []
            for col in range(dim):
                val.append(cube[(row,col,depth)])
```

```
            solver.Add(sum(val) == 1)

    for depth in range(dim):
        for col in range(dim):
            val = []
            for row in range(dim):
                val.append(cube[(row, col, depth)])
            solver.Add(sum(val) == 1)

    for depth in range(dim):
        for row in range(0, dim, N):
            for col in range (0, dim, N):
                val = []
                for i in range(N):
                    for j in range(N):
                        val.append(cube[(row + i , col + j , depth)] )
                solver.Add(sum(val) == 1)

    # gerar alguma aleatoriedade
    for i in range(N):
        randoms = []
        row = random.randint(0,dim-1)
        col = random.randint(0,dim-1)
        depth = i
        while (row,col) in randoms:
            row = random.randint(0,dim-1)
            col = random.randint(0,dim-1)
        randoms.append((row,col))
        solver.Add(cube[(row,col,depth)] == 1)

    status = solver.Solve()
    if status == pywraplp.Solver.OPTIMAL:
        mat = converter(cube, dim)

        # apagar celuas da matriz de forma a ficarem apenas alpha preenchidas
        candidates = [(a,b) for a in range(dim) for b in range(dim)]
        len_candidates = len(candidates)
        for d in range(delete):
            selected = random.randint(0,len_candidates-1)
            (row, col) = candidates.pop(selected)
            len_candidates -= 1
            mat[row][col] = 0

        return mat
    else:
```

```
        return False
```

Exemplo

[65]:
```
mat = sudoku_generator(3, 0.2)
print_sudoku(mat)
```

```
-------------------------
| 0 9 0 | 6 7 5 | 0 0 2 |
| 0 0 0 | 0 0 0 | 0 0 0 |
| 0 0 0 | 0 4 1 | 0 6 0 |
-------------------------
| 0 6 0 | 0 0 0 | 0 0 0 |
| 0 0 0 | 0 1 0 | 0 0 0 |
| 0 2 0 | 4 0 0 | 0 0 0 |
-------------------------
| 0 0 0 | 0 8 0 | 1 0 0 |
| 3 8 0 | 0 5 0 | 0 0 0 |
| 0 0 0 | 0 0 0 | 0 0 0 |
-------------------------
```

2.1.6 Outra forma mais simples de inicializar o sudoku mas que produz sudokus impossiveis

[66]:
```
def check(sudoku, row, column, number):
    if number in sudoku[row]:
        return False
    for r in sudoku:
        if r[column] == number:
            return False
    n = int(math.sqrt(len(sudoku)))
    r = (row // n) * n
    c = (column // n) * n
    for i in range(n):
        for j in range(n):
            if sudoku[r+i][c+j] == number:
                return False
    return True

def sudoku_generator_simple(N, alpha):
    dim = N*N
    filled = int(dim * dim * alpha)
    mat = [[0 for a in range(dim)] for a in range(dim)]
    while(filled > 0):
        row = random.randint(0,dim-1)
        col = random.randint(0,dim-1)
        number = random.randint(1, dim - 1)
```

```
        while(mat[row][col] != 0 or not check(mat,row,col,number)):
            row = random.randint(0, dim-1)
            col = random.randint(0, dim-1)
            number = random.randint(1,dim-1)
        mat[row][col] = number
        filled -=1

    return mat
```

Exemplo

[67]:
```
mat = sudoku_generator_simple(3,0.2)
if mat:
    print_sudoku(mat)
```

```
-------------------------
| 0 0 0 | 0 0 4 | 0 5 2 |
| 0 0 6 | 0 0 0 | 0 0 0 |
| 7 2 0 | 0 0 0 | 0 0 0 |
-------------------------
| 1 0 0 | 0 0 0 | 0 3 0 |
| 0 0 0 | 0 2 3 | 0 0 0 |
| 0 0 0 | 4 0 1 | 0 0 8 |
-------------------------
| 0 0 0 | 0 8 0 | 0 0 0 |
| 0 0 0 | 0 0 0 | 0 0 0 |
| 0 0 0 | 3 0 0 | 0 6 0 |
-------------------------
```

2.1.7 Função que resolve o sudoku

[8]:
```
def sudoku_solver(sudoku):
    solver = pywraplp.Solver.CreateSolver('SCIP')
    dim = len(sudoku)
    N = int(math.sqrt(dim))
    cube = {}

    for row in range(dim):
        for col in range(dim):
            for depth in range(dim):
                cube[(row,col,depth)] = solver.BoolVar('%i%i%i' %␣
 ↪(row,col,depth))

    for row in range(dim):
        for col in range(dim):
            val = []
```

```
            for depth in range(dim):
                val.append(cube[(row,col,depth)])
            solver.Add(sum(val) == 1)

    for row in range(dim):
        for depth in range(dim):
            val = []
            for col in range(dim):
                val.append(cube[(row,col,depth)])
            solver.Add(sum(val) == 1)

    for depth in range(dim):
        for col in range(dim):
            val = []
            for row in range(dim):
                val.append(cube[(row, col, depth)])
            solver.Add(sum(val) == 1)

    for depth in range(dim):
        for row in range(0, dim, N):
            for col in range (0, dim, N):
                val = []
                for i in range(N):
                    for j in range(N):
                        val.append(cube[(row + i , col + j , depth)] )
                solver.Add(sum(val) == 1)

    for i in range(dim):
        for j in range(dim):
            if sudoku[i][j] != 0:
                solver.Add(cube[(i,j,sudoku[i][j]-1)] == 1)

    status = solver.Solve()
    mat = converter(cube, dim)
    if status == pywraplp.Solver.OPTIMAL:
        return mat
    else:
        return False
```

2.1.8 Testes

[9]:
```
def test_sudoku(N, alpha):
    mat = sudoku_generator(N, alpha)
    print("Sudoku")
    print_sudoku(mat)
    print("")
```

```
    mat = sudoku_solver(mat)
    if mat:
        print("Solução")
        print_sudoku(mat)
        print("")
```

[2]:
```
N = [3,4,5]
times = [[None for n in N] for n in range(4)]
```

2.1.9 $\alpha = 0.0$

$N = 3$

[72]:
```
times[0][0] = timeit.timeit(stmt='test_sudoku(3,0.0)', setup='from __main__␣
 ↪import test_sudoku',number=1 )
print("Tempo de execução em segundos:",times[0][0])
```

```

```

Gráfico Tempo de Execução / N

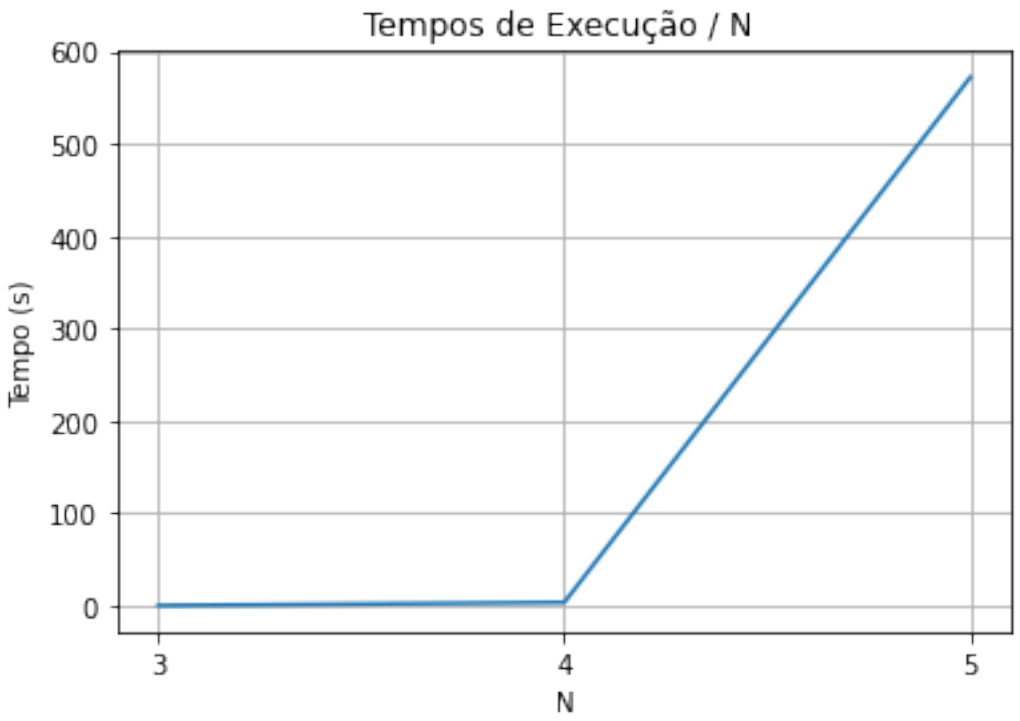
[21]:
```
plt.plot(N, times[3])
plt.xticks(N)
plt.title("Tempos de Execução / N ")
plt.ylabel("Tempo (s)")
plt.xlabel("N")
plt.grid(True)
```



2.1.13 Nota

Para $N = 5$ a função demora varios minutos a executar, pelo que para $N \geq 5$ ainda vai ser mais lento, o que deve ser provocado pelo ao facto de as soluções terem complexidade exponencial em N. Se fizermos uma analise ao número de variaveis em função de N verificamos que: - Para inicializar o sudoku temos $N^6 - N$ variaveis. - Para resolver o sudoku temos $N^6 \times (1 - \alpha)$ variaveis.
